

Week 3 — Thursday Lab: User Management & Tracking

IM102 – Advanced Database Systems | 3 Hours | Computer Lab

Today's Goal

Build an admin-only users page. Track who added each product.

Example: Adding Ownership

Want to know who added a product? Add a column:

```
ALTER TABLE products ADD COLUMN added_by INT;
ALTER TABLE products ADD FOREIGN KEY (added_by) REFERENCES users(id);
```

When inserting a product, include the current user's ID:

```
$added_by = $_SESSION['user_id'];
// ... include $added_by in your INSERT
```

Then in your product list query, JOIN to get the username:

```
LEFT JOIN users u ON p.added_by = u.id
```

Example: Users List with Stats

```
SELECT u.*, COUNT(p.id) AS product_count
FROM users u
LEFT JOIN products p ON u.id = p.added_by
GROUP BY u.id
```

LEFT JOIN ensures users with zero products still appear (count = 0).

Your Turn

Add the `added_by` column to products. Update `add.php` to record the current user's ID when creating products. Update `index.php` to show who added each product.

Build `users.php` (admin only). Show all users in a table with their ID, username, email, role (as a colored badge), how many products they've added, and when they joined.

Update existing products to belong to admin (`UPDATE products SET added_by = 1`).

Decide: should staff be able to add products? If yes, change `add.php` from `requireAdmin()` to `requireLogin()` . Your navbar should match whatever you decide.
