

Week 2 — Friday Lab: Polish, Test & Submit

IM102 – Advanced Database Systems | 3 Hours | Computer Lab

Today's Goal

Test everything, fix issues, make it look good. Submit.

What Should Work

Your inventory system should have:

- A list page with product name, category name, supplier name, price, stock
 - Search by product name and filter by category (working together)
 - Low stock products highlighted in red
 - Summary cards with aggregate stats
 - Add form with database-populated dropdowns
 - Edit form that loads data and pre-selects dropdowns
 - Delete with full product details and confirmation
 - Reports page with per-category and per-supplier breakdowns
 - All inputs escaped, numbers cast, redirects after POST
 - Consistent CSS across all pages
-

Common Issues to Check

- Products showing wrong category name? → Check your `JOIN ON` condition
 - Delete fails with foreign key error? → Need `ON DELETE SET NULL` on your FK
 - Reports showing wrong numbers? → Make sure you're using `LEFT JOIN` for categories with zero products
 - Search not finding anything? → Check the `LIKE` pattern has `%` on both sides
 - Forms losing data on error? → Keep `$_POST` values in the inputs with `value="<?=<br>htmlspecialchars($_POST['name'] ?? ' ') ?>"`
-

Your Turn

Go through every page. Test every feature twice — once with normal data, once with edge cases (empty search, invalid ID, blank form). Fix whatever's broken.

Add a simple navigation bar at the top of each page linking between Products, Reports, and Add Product. Better to put this in a `navbar.php` file and include it everywhere — change it once, updates everywhere.

Export your database, ZIP everything, submit.
